

Apache Kafka 0.10.2.0正式发布

Apache Kafka 0.10.2.0正式发布，此版本供修复超过200个bugs，合并超过500个PR。本版本添加了一下的新功能：

- 1、支持session windows，参见KAFKA-3452
- 2、提供ProcessorContext中低层次Metrics的访问，参见KAFKA-3537
- 3、不用配置文件的情况下支持为 Kafka clients JAAS配置，参见KAFKA-4259
- 4、为Kafka Streams提供全局Table支持，参见KAFKA-4490

[Apache Kafka 0.10.2.0 RELEASE NOTES](#)下载[Apache Kafka 0.10.2.0](#)

完整的邮件信息

The Apache Kafka community is pleased to announce the release for Apache Kafka 0.10.2.0. This is a feature release which includes the completion of 15 KIPs, over 200 bug fixes and improvements, and more than 500 pull requests merged.

All of the changes in this release can be found in the release notes:
https://archive.apache.org/dist/kafka/0.10.2.0/RELEASE_NOTES.html

Apache Kafka is a distributed streaming platform with four core APIs:

** The Producer API allows an application to publish a stream records to one or more Kafka topics.

** The Consumer API allows an application to subscribe to one or more topics and process the stream of records produced to them.

** The Streams API allows an application to act as a stream processor, consuming an input stream from one or more topics and producing an output stream to one or more output topics, effectively transforming the input streams to output streams.

** The Connector API allows building and running reusable producers or consumers that connect Kafka topics to existing applications or data systems. For example, a connector to a relational database might capture every change to a table.three key capabilities:

With these APIs, Kafka can be used for two broad classes of application:

** Building real-time streaming data pipelines that reliably get data between systems or applications.

** Building real-time streaming applications that transform or react to the streams of data.
